## IMU

- ▶ Components:
  - ▶ Accelerometer
  - ▶ Gyroscope
  - ▶ Magnetometer
- ▶ Acceleration and Rotation are measured for all three euclidian axis

Source: <https://vrtracker.xyz/handling-imu-drift/>

## Stereo Camera

- ▶ 2 aligned monocular cameras
- ▶ Distance (baseline) between the cameras is known
- ▶ The distance between an object, located in the overlapping parts of the FOVs and the cameras can then be calculated

Source: <https://www.intechopen.com/books/coding-theory/efficient-depth-estimation-using-sparse-stereo-vision-with-other-perception-techniques>

## Idea:

- Take the raw IMU measurements between two keyframes
- Calculate a motion constraint (Preintegrated IMU Measurement) between both keyframes

Source: [Forster et al., 2015]

- ▶ For Keyframes:
  - ▶ 1. Stereo Matching
  - ▶ 2. Identify Landmarks (Features)
    - ▶ Shi-Tomasi Corner Detection
    - ▶ Detect Corners via threshold  $R = \min(\lambda_1, \lambda_2)$
  - ▶ 3. Geometric Verification
    - ▶ Different variations of RANSAC-Algorithm
- ▶ For Intermediate Frames:
  - ▶ Track Landmarks
    - ▶ Lucas-Kanade Tracker
    - ▶ Observe a neighbourhood of Voxels in an image
    - ▶ Calculate the movement based on the differences in the images

# Feature/Landmark Detection

# VIO-Backend - Fixed Lag Smoothing

Motivation

VIO

RPGO

3D Mesh

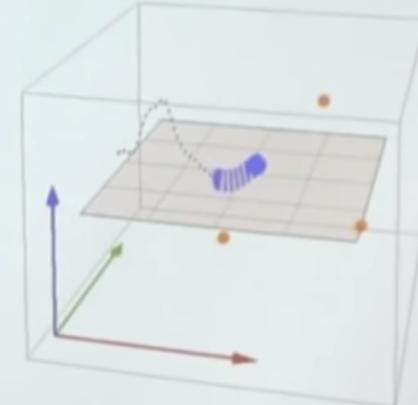

Semantics

Conclusion

References

- ▶ Fixed-lag Smoothing:
  - ▶ Estimate states in a given time window
  - ▶ Marginalize older states
- ▶ Advantages:
  - ▶ more accurate than filtering (e.g. EKF), for nonlinear problems
  - ▶ Relinearization of past observations
- ▶ Disadvantages:
  - ▶ Marginalization lowers accuracy
  - ▶ Common with Filtering
    - ▶ Consistency is problematic
    - ▶ Linearization errors

## Fixed-Lag Smoothing

Semantics

Conclusion

References

Odometry measurement

Bipartite graph with *variable nodes* and *factor nodes*

Source: <https://www.youtube.com/watch?v=Q313pTMAdcM>

# Factor Graphs

Motivation

VIO

RPGO

3D Mesh

Semantics

Conclusion

References

- ▶ How do we predict an pose at time  $t_i$  from the factor graph?
  - ▶ 1. Convert the factor graph to a bayes network
  - ▶ 2. Convert bayes network to bayes tree
  - ▶ 3. Solve it with iSAM2-Algorithm
    - ▶ Part of GTSAM, C++ Open-Source Library
- ▶ But why?
  - ▶ The bayes tree can be updated incrementally
  - ▶ **Which also means** that we only need to calculate the updated parts of the tree
  - ▶ This makes it possible to apply it for real-time odometry
- ▶ Output

$$\operatorname{argmin}_{\theta} = \sum_i \|h_i(\theta) - z_i\|_{\theta}^2 \quad (1)$$

- ▶ Linearized:

$$\operatorname{argmin}_{\theta} \|A\theta - b\|^2 \quad (2)$$
